

WHAT IS CLAIMED IS:

1. A bicycle treadle comprising a treadle body, a front hook locking to a locking surface of the treadle body; a rear hook locking to a rear side of the treadle body; and an elastomer resisting against the rear
5 hook;

a front end of the front hook being formed with a buckle; the buckle having a hole; each of two sides of the buckle contacting with the front hook having a tilt surface; a buckling sheet being buckled to the buckle of the front hook; two rear sides of the front hook having respective
10 wings; each wing being protruded from a surface of the front hook; two sides of the rear hook having respective limiting stops corresponding to the wings; in assembly, the two limiting stops resisting against the two wings;

wherein in use, a buckling sheet in a sole of a shoe is buckled with
15 the buckle so that the shoe is fixed therein.

2. The bicycle treadle as claimed in claim 1, wherein two front lateral sides of the front hook have respective protruding portions for facilitating the assembly of the buckling sheet to the buckle.

3. The bicycle treadle as claimed in claim 1, wherein each of the
20 two rear lateral sides of the rear hook has a lateral locking hole; a rear locking hole is formed between the two lateral locking holes so that the rear hook is locked to various treadle body.
